

Irrigation mediated transfer of *E. coli* O157:H7 from feces to lettuce, 2011 & 2012
 Rob Atwill, Jennifer Chase, M. Jay, L. Harris, R. Bond, M. Partyka, WCFS field & lab crew
 Western Center for Food Safety, UC Davis
 David Oryang, Sherri Dennis, RTI International (M. Anderson, A. Mokhtari), ARS-Salinas, etc.

Technical Forum on Produce Safety
 JIFSAN & FDA, College Park, MD
 February 8-9, 2017

Primary vertebrate source(s) and key mechanism(s) of *E. coli* O157:H7 contamination of leafy green commodities in the preharvest production environment

Cow-calf herds, central coastal CA, 2008-2010
E. coli O157 infection ranged from 0% to 10%

<u>Herd</u>	<u>pos</u>	<u>n</u>	<u>prev (%)</u>
A	0	489	0.0
B	7	480	1.5
C	0	200	0.0
D	44	434	10.1
E	0	61	0.0
F	6	386	1.6
G	2	271	0.7
H	9	256	3.5
I	0	138	0.0
Total	68	2715	2.5

CA statewide survey of 20 cow-calf herds, 2012-2013

Butte, Contra Costa, Humboldt, Kern, Lassen, Madera,
 Modoc, Mono, San Joaquin, San Luis Obispo, Solano,
 Stanislaus, Tuare and Yuba County (14 counties)
 1412 cows and calves

Prevalence (%) of fecal shedding (positive/total)

	Salmonella	E. coli O157	Cryptosporidium	Giardia duodenalis
Cow	0.4% (3/726)	5% (37/726)	9% (67/726)	23% (168/726)
Calf	0.15% (1/686)	5% (35/686)	20% (136/686)	42% (286/686)
TOTAL	0.3% (4/1412)	5.1% (72/1412)	14.4% (203/1412)	32% (454/1412)

Sierra Foothill
 Research &
 Extension Center,
 University of California

Buffer width (m)
 0.1, 1.1, 2.1

Land slope (%)
 5, 20, 35

RDM (kg/ha)
 225, 560, 900, 4500

Rangeland buffers appear to retain ~95%
 of *E. coli* in winter and spring;
 >99.9% achievable under certain conditions

Tate et al., 2006. J. Environ. Qual. 35:795-805.

Wildlife and beef cattle from
 central coastal CA, 2008-10

E. coli O157:H7

Feral pig	10/200	(5%)
Coyote	2/95	(2%)
Am. crow	5/93	(5%)
Cowbird	2/60	(3%)
Rabbit	0/108	(0%)
Skunk	0/63	(0%)
Tule elk	3/150	(2%)
Deer	0/447	(0%)
Rodents	2/1043	(0.2%)

Beef cattle 68/2715 (2.5%)

Salmonella enterica

wildlife	17/449	(3.8%)
cattle	1/795	(0.13%)

wildlife shedding was 30 times
 higher compared to cattle ($P < 0.001$)

Wildlife often congregate in groups

Prevalence = 5%

What is the probability of ≥ 1 positive bird
 in this group of 10 crows? 40%

Prevalence of pathogens in wild rodents in produce fields, central California, 2009-2011
n=8113 trap nights, 13% trap success (1071 rodents)

E. coli O157:H7 2/1,043 (0.2%)
Salmonella 30/1,043 (2.9%)
~50% *S. enterica* subsp. *arizonae* (IIIa)
~30% *S. I* 6,8:d:-

Rodent species	<i>Cryptosporidium</i>	<i>Giardia</i>
CA parasitic mouse	11%	13%
Deer mouse	33%	27%
Dusky-footed wood rat	17%	17%
Total	26%	24%

Cryptosporidium: 4.3×10^8 oocysts/g feces; ~50% appear infectious for humans
Giardia appears not infectious to humans

Kilonzo et al., 2013. Appl. Environ. Microbiol. 79(20):6337-6344

13

Winter precipitation runoff versus summer tail-water flows

cow-calf ranches
1.4 to 7 deer mice/acre
0.05 to 2.7 cattle/acre

produce field
1 to 34 deer mice / acre
(mean of 8.5 mice / acre)
0 cattle in produce field

Field trials of romaine lettuce: fecal transfer during irrigation
ARS Salinas, California, July 2011

Atwill et al., 2015. J. Food Prot. 78(2):240-247

1.3×10^8 CFU of *E. coli* O157:H7 in 5 grams rabbit fecal slurry

Timeline for Exp A & B
irrigate on 7/14/2011

- Fecal deposit 5 gm / cluster
 - July 2011
 - rabbit only
 - July & October 2012
 - rabbit & pig
- 1 tech depositing fecal to minimize error

- Tootsie-Rolls (aka fecal patties)
 - ~1:1 fresh feces : PBS-*E. coli* O157
 - 2011 rabbit feces
 - 2012 rabbit & pig feces
- Homogenized with stomacher
- 5 gm field patties
- 1 gm validation patties
 - 10-fold serial dilutions
 - 3 concentrations x 3 reps
 - No significant difference between field/lab

Lettuce sampling after irrigation

Bacterial MPN method

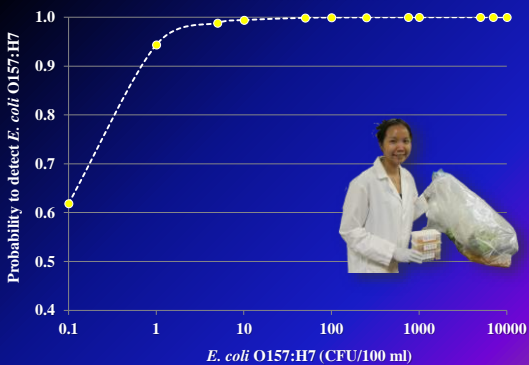

- High concentration assay
 - Detection limits
 - 340 – 3.5 × 10¹² mpn/head
 - 2 × 6 mpn (1 ml – 1 × 10⁻¹⁰)
 - 100-fold serial dilutions

- Low concentration assay
 - Detection limits
 - 2011: 1.8 – 550 mpn/head
 - 2012: 1.1 – 420 mpn/head
 - 4 × 3 mpn (5, 10, 50, 100ml)
 - 2011: 3 × 3 mpn (1, 10, 100ml)

Sensitivity of MPN protocol to detect *E. coli* O157:H7 on heads of Romaine lettuce

2.5 hours of overhead irrigation using Nelson rotator emitters 1.25 to 3.85 mm applied

38% of lettuce heads within 70 cm (28 in) of scat had an average 7.4×10^5 *E. coli* O157:H7 after irrigation (1.3 to 230,000 MPN). Relative to the original load of 1.3×10^8 CFU of *E. coli* O157:H7 in 5 g, about 0.000057 (0.006%) transferred to the outer leaves of lettuce.

2.5 hours of overhead irrigation using Nelson rotator emitters
1.25 to 3.85 mm applied

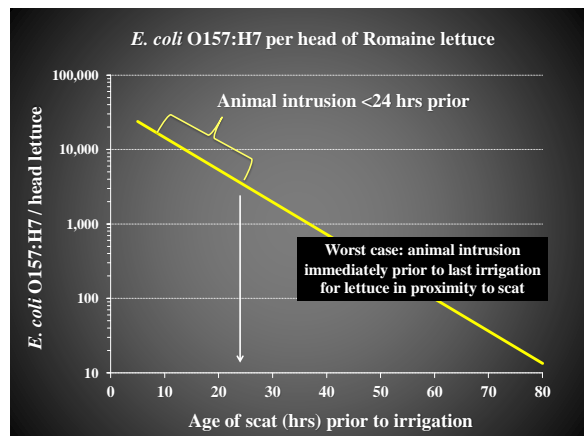

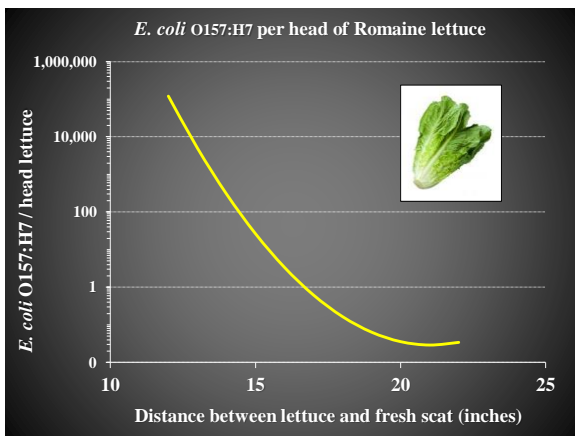

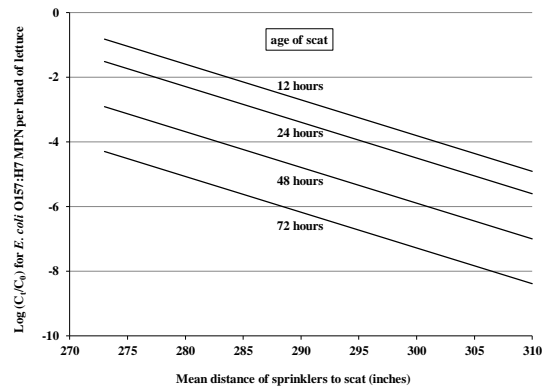

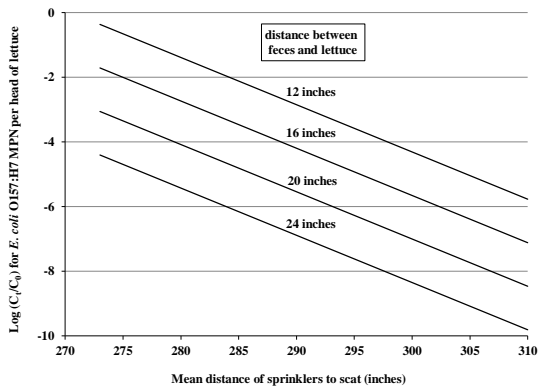

38% of lettuce heads within 70 cm (28 in) of scat had an average 7.4×10^3 *E. coli* O157:H7 after irrigation (1.3 to 230,000 MPN). Relative to the original load of 1.3×10^8 CFU of *E. coli* O157:H7 in 5 g, about 0.000057 (0.006%) transferred to the outer leaves of lettuce.

Negative binomial regression: $C_i = e^{(\alpha + \beta X_i)}$, $[\log(E(Y|X) = \alpha + \beta X)]$
 $\log(C_i/C_0)$, with C_0 set at 1.3×10^8 MPN *E. coli* O157:H7/head

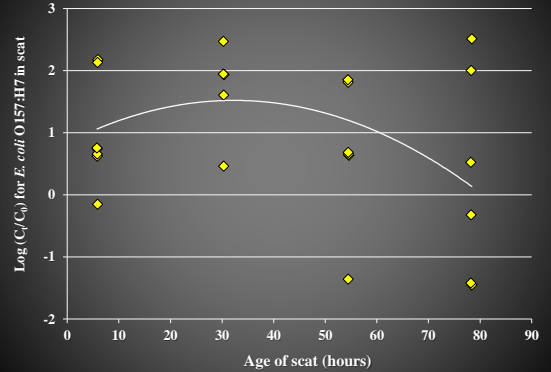

Factor	Coefficient	95% CI ^a	P value ^b
		Model 1 (AIC ^c = 264)	
Intercept	119.1	84.8, 153.3	<0.001
Distance between feces and lettuce (cm)	-0.305	-0.38, -0.23	<0.001
Distance between sprinklers and feces (cm) ^d	-0.133	-0.17, -0.09	<0.001
Aspect of wind relative to bed			
Downwind ^e	0.0		
Upwind	-6.88	-9.46, -4.31	<0.001
		Model 2 (AIC ^c = 262)	
Intercept	87.9	42.5, 133.3	<0.001
Age of feces before irrigation (h)	-0.134	-0.18, -0.08	<0.001
Distance between sprinklers and feces (cm) ^d	-0.100	-0.16, -0.04	0.001
Aspect of wind relative to bed			
Downwind ^e	0.0		
Upwind	-4.87	-8.45, -1.30	0.008

^a The assay used for enumerating *E. coli* O157:H7 per head of lettuce was designed to estimate ≥ 340 MPN per head.
^b The 95% confidence interval (CI) and P values adjusted for potential correlated bacterial data within each cluster of six adjacent heads of lettuce that surround a rabbit fecal deposit with an average bacterial load of 1.29×10^8 CFU of *E. coli* O157:H7.
^c AIC, Akaike Information Criterion.
^d Mean distance of the four sprinklers to the fecal deposit for each cluster of six heads of romaine.
^e Referent category; lettuce head was downwind of the fecal deposit (lettuces located on north-facing, windward edge of bed).

E. coli O157:H7 remaining in scat post irrigation

Rodent traps set each day of experiment
 9 rodents trapped, 4 separate individuals
 3 × for adult female tag 226 (lactating)
 4 × for adult male tag 227 (positive on 3rd)

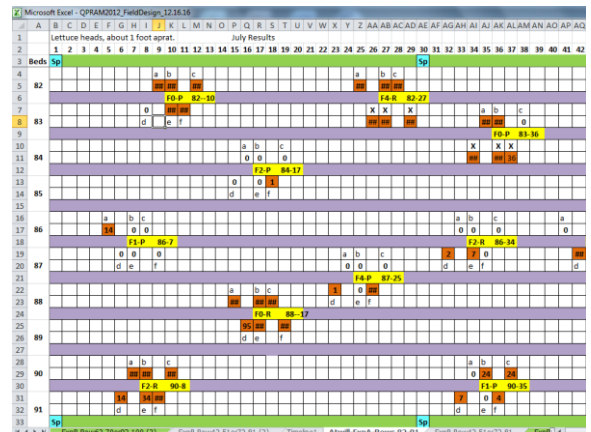

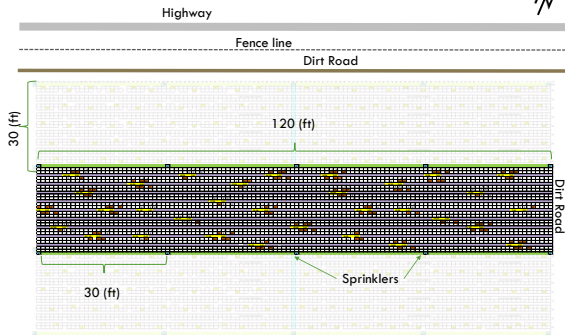

positive control
 strain from male deer mouse #227

FSMA 2015: Minimize fecal contamination from domestic and wild animals in the produce field:

- Farmers are required to take all measures reasonably necessary to identify and not harvest produce that is likely to be contaminated.
- Requires all covered farms to visually examine the growing area and all covered produce to be harvested, regardless of the harvest method used.
